

## Flashing Furnace for Explosives an organic residues

Organic residues in small containers for transport or storage of military goods or parts of ammunition can safely eliminate with sonUtecs Flashing Furnace.

Removing the remaining residue from grenades after they have been treated by sonUtecs EXPLOMELT unit is another field of application for our Flashing Furnace.

The Flashing Furnace is approved to be used for ensuring that the scrap is free of explosives and organic substances.

The kiln consists of steel construction with refractory lining, mounting fixture, fan, air in- and outlet and switch cabinet.

Heating of the kiln is done indirectly via electricity.

It is possible to enter several different heating cycles by using the operator panel of the switch cabinet.

The recirculation of the heated air destroys all organics residues.

The air exchange is controlled by flaps for air inlet and outlet, no explosive mixtures can form.

Flashing Furnace
