

Wet Scrubber for Glass Fiber Products

The proper manufacturing of glass fabrics needs a finish to supply the production steps. High amounts of these substances are vaporized in hot drying machines. They are a part of the exhaust air and have to be filtered. In addition a lot of humidity and short broken fibers are in the exhaust air, which also have to be removed.

sonUtec designed and installed a wet scrubber system. Collecting the air by pipes is another part of the scope of delivery. The scrubber is designed very rugged and the maintenance is simple. Circuit liquid passes through a self-cleaning sieve to catch fibers.
