

After-sales / Maintenance / Measurement

In addition to plant planning/engineering, production and assembly of systems, also after-sales service, regular maintenance and measurements are on the product portfolio of sonUtec.

In all branches of industry, machines must run reliably. The prerequisite for this is regular maintenance. Proper maintenance of the equipment has the advantage that the installed equipment is regularly checked for its operational safety and functionality during the visit by our trained personnel. Wear and defects in components are recognized at an early stage and can be exchanged or corrected without incurring longer downtime for our customers. During maintenance, data are regularly collected on the system, which gives us a history of the plant.

Example:

In the case of a catalytic oxidizer built by sonUtec in 2004, an FID measurement is carried out at least once a year. The measurement with our company's own flame ionization detector serves to optimize the system and allows conclusions to be drawn regarding the state of the catalyst material and the overall system. Most important conclusion for our customers:

At all our plants, no wear on the catalysts has ever been observed!

In that way, our longtime customers guarantee a high level of operational reliability and low failure rates!
